WOOD'S CROP SPECIAL

Giving Timely Information and Prices of Seasonable Seeds

PUBLISHED BY T.W. WOOD & SONS SEEDSMEN RICHMOND VA.

VOL. XVII.

SEPTEMBER EDITION

1922

Our "Wood's Crop Special" is issued monthly during planting seasons. There is no subscription price, but is mailed free upon request. If any of our customers do not receive Wood's Crop Special regularly, and desire to do so, advise us and we will place your name on our regular mailing list.

SEASONABLE NOTES

The fall season has opened with the wholesome indication that Southern farmers are planning to increase their acreage in pasturage, as well as the quantities of feed grown on the farm. The extent of land sown to grain crops in the fall is growing each year, and wheat, oats, rye and barley are all becoming more and more popular in the South, as the profit in growing them is being recognized.

A great need in many parts of the South has been for soil-improving crops, and planters are supplying this need by putting in the legumes, principally **Crimson Clover** and **Vetch**.

Abruzzi Rye continues in great favor, and for the Coastal Plains section of the South we recommend this and our **South-ern-grown Winter Rye**.

For the Piedmont Section of Virginia and the Carolinas our **Piedmont Winter Rye** will doubtless be found better.

These varieties are, for the respective sections named, the best for winter and spring grazing. They are both earlier than the regular Winter Rye or Western Rye, and their good stooling habit means a thicker and more succulent pasturage.

Experiments made in South Carolina seem to indicate that while rye will stand more freezing and has the capacity to absorb more moisture than any other winter grain crop, barley make better pasturage where these conditions do not exist.

Fulghum Oats are of the rust-proof type, so can safely be planted in sections where there is risk of other oats being affected by rust. They are earlier than the familiar Red Rust Proof Oats, however, and can be cut ahead of these and before wheat harvest. The **Fulghum** also stools out remarkably well and makes a large and well-filled head.

For the mountainous districts the **Virginia Gray Winter or Turf Oat** is preferable on account of its extreme hardiness. Its stooling qualities are excellent, and the yield of grain is larger than that of any other fall sown oat.

If you are interested in lawns or public grounds, let us send you our **Lawn Circular**. You will find it helpful.

Our **New Fall Catalog** gives the most up-to-date information regarding both field and garden crops. If you have not received a copy, write for it today. Free upon request.

CRIMSON CLOVER FOR THE SOUTH

Sow Crimson Clover and save fertilizer bills. Much attention has been given to **Crimson Clover** on account of its value as a soil improver, as well as a winter cover crop. Sown in the corn field after cutting corn, it will prevent winter-leaching of the land. In addition to its great value as soil improver, it furnishes excellent grazing during the late fall, winter and early spring, and is one of the earliest, best and most nutritious crops that can be put in for cutting for early green feed.

Crimson Clover makes a first-class green forage crop, provided it is cut just after it has come into bloom, before the seed forms. It can be used for grazing, early green feed or hay, and even then the conditions and productiveness of the land will be improved to a wonderful extent wherever it is grown.

For dairymen and cattle raisers, **Crimson Clover** is indispensable, both for its value as a winter and spring grazing crop and for early green food.

As a winter, spring and early summer grazing crop, **Crimson Clover** is unsurpassed. A great many of our cattle raisers in this section depend upon **Crimson Clover** for the early grazing and fattening of sheep and cattle, until their regular pastures come into use.

For truckers and market gardeners, **Crimson Clover** saves fertilizer bills, supplying humus and nitrogen to the soil, increasing productiveness, and the quality of crops to a wonderful extent.

There is very little trouble in getting a satisfactory stand, provided proper care is used in seeding. The land should be prepared some time previous to sowing. It should be harrowed and cross harrowed so as to give a good firm seed bed, always remembering that a good firm seed bed is essential for a satisfactory stand, and too much care cannot be given along these lines. Immediately after a rain, run a harrow over the field, and sow the seed, covering lightly with a brush harrow. **Crimson Clover** will thrive better on light soils, and will withstand adverse weather conditions better than on heavier soils.

For the Middle Atlantic and Southeastern States there is no better crop that can be sown this month for forage, green manure or winter cover crop. It is of special value as a green manure crop to increase the humus and nitrogen content of the soil upon which it is produced. The really remarkable soil improvement resulting from the use of **Crimson Clover**, makes it very desirable that as large an area as possible be seeded to this leguminous crop. Instances are not rare where the yields of corn have been increased from 10 to 70 bushels per acre by the use of this valuable legume in rotation.

GRASS AND CLOVER MIXTURES**

SEE PAGE 3 OF THIS ISSUE.

WOOD'S CROP SPECIAL.

ALFALFA

One of our most important fall and spring forage crops. This valuable legume, containing a large per cent. of protein, is exceedingly valuable for pasturing or cutting for hay. Alfalfa produces a most nutritious hay for feeding horses, cattle and all live stock, and the hay is always readily saleable, usually bringing the highest market prices. When once established it continues to give large yields for a number of years with very little care and attention. Alfalfa thrives best on good, rich soil, well drained and free from acidity. Special care should be taken in preparing the soil for this legume, as a good, firm seed bed is of first importance. The ground should be plowed as early as possible, harrowed and re-harrowed so as to get it in first-class condition, and kill any weeds which may be in the soil. It is advisable to plant after a good rain, breaking the crust with a light harrow, and then sowing the seed, afterwards covering with a brush harrow. Sow only the highest quality American grown dry land Alfalfa for best results. Full information in regard to preparation and sowing is given on page 3 of our new Fall Catalog, and inoculation on page 10. Sow at the rate of 20 to 30 pounds to the acre broadcast, in September.

SEED OATS

Best results are usually obtainable from fall sowing, as oats require cool, growing weather and plenty of moisture for bumper crops. They can be planted as late as November, after corn and tobacco are cut, and make an excellent winter cover crop. For early seeding we recommend the **Virginia Gray Winter**, and the **Fulghum** for late seeding.

FULGHUM OATS are one of the earliest and largest yielding of either spring or fall sown oats. We have made thorough tests of all oats, both fall and spring seedings, and have found the **Fulghum** has no equal in yield, growth or maturity. Stools out well and produces large, full heads of fine, plump grains, and strong straw that stands about 3½ to 5 feet high. We strongly recommend this variety to our customers, believing it to be the very best variety for either fall or spring sowing. **Fulghum Oats** are ready to cut just ahead of wheat, so the harvesting of the two crops will not conflict, and this advantage should be considered when arranging your work for next summer's harvest season.

VIRGINIA GRAY WINTER OATS are later in maturity than the **Fulghum**, and are usually ready to cut after wheat harvest. This variety is very popular on account of its hardiness, withstanding the most severe winters. The **Virginia Gray Winter** stools out better than any other fall sown oats, and is consequently a very heavy yielder. Our test of this variety showed up remarkably well, growing to a height of 3 to 4 feet, with large, well-filled heads. Sow in September or early in October for best results.

ARLINGTON BEARDLESS BARLEY

Barley is a valuable crop for sowing in the field for late fall, winter and spring grazing. It also makes a good hay crop when cut in the green state. **Barley** is considered to make stronger and more nutritious feed than any of the grain crops, and it is increasing in popularity all throughout the South. It is a well-established fact that horses fed on crushed barley do not suffer as much from heat as when fed on other grains.

We have been particularly pleased with **Arlington Beardless Barley**. Wherever tried, it is preferred to the bearded, whether for grazing or for harvesting as a grain crop.

A customer in Albemarle County, Virginia wrote us:

"**Arlington Beardless Barley** makes fine hay; stock like it so much better than rye, and it is just as early. Cut mine the last of April, two weeks ahead of crimson clover."

Another, in Greene County, North Carolina, wrote:

"I find **Arlington Beardless Barley** to be an exceptionally fine kind of grazing. Nothing in the barley line to equal it, making a crop of fine heads after grazing through winter."

"19 Bushels to the Acre in a Bad Year."

Last year I got my Seed Wheat from you. It was a bad year for wheat here in this part of the State, but with all that I made 19 bushels of fine wheat to the acre. The kind I got was **Leap's Prolific**.—L. C. TOMPKINS, Kanawha County, W. Va., August 24, 1922.

VETCH

Vetch is a wonderful soil improver and thrives on practically all types of soil. The hay is greatly relished by all kinds of live stock, and on account of its large per cent. of protein it is highly recommended for its fattening qualities.

For a winter cover crop or soil improver, either variety of **Vetch** may be sown alone at the rate of 40 to 50 pounds to the acre. For hay, however, we consider it better to sow with oats, and our preference has been the rust proof type for this purpose. The proportions we sow are 3 pecks of oats with 25 to 30 pounds of vetch to the acre. The sowing may be done either in September or October.

Hairy Vetch is the most hardy vetch, and its popularity is widespread throughout the country. As well as making large yields of hay, and furnishing splendid grazing, it is an excellent nitrogen gatherer and soil improver. **Hairy Vetch** is very scarce this year, and as stocks are limited we advise booking orders early for new crop seed, which will be ready for delivery early in September.

OREGON VETCH is rapidly gaining favor wherever used, and we believe it is destined to be equally as popular as regular **Winter** or **Hairy Vetch** in the South. Although not quite as hardy as the **Hairy Vetch**, its yield is equally as good in our Southern climate. **Oregon Vetch** is quite generally sown with oats, to give the vines support, preferably the **Rust Proof** or **Fulghum**. Our stock of this, however, is temporarily exhausted, but will book orders now for shipment about October 10th.

DWARF ESSEX RAPE

An excellent and economical fall, winter and spring pasture, and should be liberally seeded everywhere for cattle, sheep, hogs and poultry. It makes a large yielding, nutritious and succulent green feed and pasture all through the fall, winter and early spring. The fattening properties of **Rape** are very much better than those of clover, and it makes a first-class crop for sowing alone for grazing. Can be sown during September or October—the earlier the better—either broadcast at the rate of 6 to 8 pounds to the acre, or in drills 3 to 5 pounds to the acre.

SEED WHEAT

The use of **NEW SEED WHEAT** properly cleaned and free from a large percentage of shriveled grains is the surest and best method of increased yields. This plan is becoming more and more the general practice of the largest growers throughout the South. An increased yield of one bushel per acre will more than pay for the difference in price between seed stock and ordinary farmer's run of wheat.

The unfavorable weather at the time of harvest, as well as the season in general, has resulted in comparatively little fine seed wheat being made in the eastern part of this country. Consequently we have taken great care in selecting our stocks of **Seed Wheat**, which have been drawn from the largest producing crops in the Eastern States. Samples will be cheerfully sent upon request, and upon examination we know that our customers will be more than pleased with the plumpness and general high-grade quality.

WOOD'S SPECIAL GRASS AND CLOVER MIXTURES

These mixtures are composed of only the very best seeds, all of **Wood's Trade Mark Brand** quality. They contain from 9 to 13 different varieties of grasses and clovers, mixed in proper proportion for soils to which they are recommended, and have given the best of satisfaction wherever used. They have an enviable reputation for furnishing an abundance of hay and excellent grazing where the sowing of only one or two grasses have failed. The increased number of orders that we receive every season for our **Special Mixtures** is evidence that they give the largest yields of hay and pasture.

We have especially prepared for our own experience five mixtures for permanent pasture and four for mowing for hay, put up for different types of soil. Full information is given on pages 6 and 7 of our New Fall Catalog.

To any of our customers who have any special formulas for mixtures of grasses and clovers which they expect to put in this fall, we shall be pleased to quote prices on their requirements, either mixed or separately. We make no charge for mixing grasses and clovers for our customers.

Prices of Field Seeds are always subject to market fluctuations. We always fill all orders entrusted to us at lowest ruling prices on date order is received. If prices decline, we give our customers the benefit of it. If they advance, we charge the advance on order. Mention date and number of "Wood's Crop Special" upon which the order is sent.

Terms on all Field Seeds, net cash. Customers who have no regular accounts with us will kindly remit the amount with their order or name business reference as customary before opening new accounts.

While we exercise great care to have all seeds pure and reliable, we give no warranty, express or implied, as to description, quality, productiveness, or any other matter connected with the goods we send out, and will not be in any way responsible for the crop. Every order for articles named in this price-list will be executed on these conditions only.

ARLINGTON BEARDLESS BARLEY..... 1.35 1.40

CANADA FIELD PEAS

OUR SEED OATS are free from stains and of exceptional high-grade quality. The general run of stock this year is weathered and of poor quality.

WOOD'S GRAIN PASTURE MIXTURE

Will provide an excellent quick pasturage during the fall, winter, spring and early summer.

Sow during August, September or October, at the rate of 2 bushels per acre.

Per bushel (50 pounds), \$1.40; 5 bushel lots and over, \$1.35 per bushel. Sacks included.

SEED WHEAT

The Seed Wheat we offer is thoroughly recleaned and of fine quality. This should be especially noted the present season; because unfavorable weather conditions at time of harvest time resulted in comparatively little fine Seed Wheat being made in the eastern part of the United States, and good wheat is going to be scarce. Write for samples.

We do not advise early shipment, on account of the fact that keeping wheat stored in warm weather in the South may cause infestation of weevil; but will book orders now at the prices named for shipment during October or November. Prices include new grain sacks.
